Japanese fonts as symbols for English words, including.. is by Morisawa?Depression in pain patients treated with combined disease-modifying antirheumatic drugs: a population-based cohort study. Pain is often present in patients with rheumatic diseases, and commonly co-occurs with depression. Disease-modifying antirheumatic drugs (DMARDs) might be effective in preventing and/or treating pain, but potentially worsen depression. This study aimed to investigate the potential relationship between DMARDs and depression in patients with rheumatic diseases. This register-based cohort study analysed data from the Medical Birth Registry of Norway, which have high validity. The study population comprised 46,139 patients born in 1952-1953, who were followed in the Norwegian Rheumatism Register from 1996 to 2014. Main outcome measures were incidence and severity of depression. Data on treatment with DMARDs were retrieved from the Medical Birth Registry of Norway. Data on covariates were obtained from the Norwegian Prescription Database. Fifty-five percent of patients developed depression; the highest incidence was found in patients taking DMARDs. DMARDs

were associated with a reduced risk of developing depression, adjusted for sex, age, low socioeconomic status, cardiovascular disease, back pain, rheumatoid arthritis, diabetes, obesity, smoking, alcohol use and antidepressant use (adjusted hazard ratio [aHR]: 0.55; 95% confidence interval [95% CI]: 0.55-0.55). The analyses revealed no association between DMARD use and depression severity. The use of DMARDs was associated with a reduced risk of depression. This study suggests that DMARDs could be regarded as a preventative treatment for depression.Pages Wednesday, November 11, 2009 The Unknown I know there are a lot of bloggers out there that write about their interests and are also very talented artists. When I discovered Sis's blog, I was overwhelmed with the beauty of her work. She is very creative and like someone told me, she is very organized.

A: As muzibix said, it is a special font that has a much wider Unicode block than other fonts. The "other" A font you mentioned is meant to be used with a designer. It is not going to do what you want. It is for Pro fonts used in the design of a magazine, and is created specifically for good looking shapes with very precise dimensions. It has wide characters to create more

room between two lines of text. Q: On Gcc, why can I not use string constant at compile time but can at runtime? I was trying to use a string constant at compile time. I had done the below program with following code. #include char const str[] = "Hello World!"; int main() { printf("%s ", str); return 0; } Here i was getting an error "expected expression". But if i tried at runtime then the program compiled fine. Why is this case? #include #include char const* str = "Hello World!"; int main() { printf("%s ", str); return 0; } A: This is because the implementation of the string literal is determined at run time. In the first case, you're constructing it at compile time, thus the compiler needs the constant expression to be evaluated at compile time. In the second case, the literal is already present in the object file so the linker only needs to link the correct string literal to the address. // // "$Id: PopUpErrorDialog.cs,v 1.4 2005/10/07 13:25:43 bene Exp $" // // PopUpErrorDialog.cs // A dialog box that displays a 'pop-up' style message box. // // Author: Simon Steele // // Copyright (C) 2004 Simon Steele // // This library is free software; you can redistribute it and/or modify it // under the terms of the GNU
