In order to crack a file one must be able to crack the file. Once the file has been cracked the crack will be in a form that can then be decompressed. Decompression will extract the file's contents and allow you to use the file without having to crack the file. You can crack most of the files that you download directly from the Internet using the command line. Direct downloads come from sites that are known to be safe and which allow you to download the file from there directly into your download folder, or into a directory that you specify. These sites all have a similar look and feel, although some offer a.exe, or executable (.com extension), file while others offer a .bin file instead.
